

# Editorial

Dear Colleagues, over the past decade, otorhinolaryngologists have adopted the trend for minimally invasive surgery and have developed techniques for conditions that previously required extensions, morbid external procedures. Better diagnostic support, improved instrumentation and computer aided surgeries have helped rhinologists to explore successfully those areas which were once considered to be beyond their scope. Today, rhinologists are pursuing endoscopic approaches to the skull base and thus endoscopic techniques for transsphenoidal hypophysectomy, resection of fibro-osseous lesions, clivus tumors and even paranasal sinus neoplasms.

I am extremely happy presenting to you the second issue of the year. This issue of 'Clinical Rhinology' presents you with a wide range of articles from latest development in surgical rhinology to interesting case reports. This issue has few articles related to skull base, an upcoming, expanding and challenging field in rhinology.

I would request all our authors to contribute more of original articles and case series so that we can achieve our goal of getting this journal indexed as soon as possible.

Finally, I acknowledge and thank all the authors for sharing their ideas at this forum which will drive the future innovations that help in patient care.
