

# Editorial

Rhinology has gained popularity over the last decade with the development of endoscope, allowing excellent visualization of anatomical structures and taking over from mutilating external incisions. Apart from chronic sinusitis, even nose and paranasal tumors are also dealt with endoscopically. These have all been possible because of better understanding of the disease process, newer generation imaging modalities, high definition endoscopic system, robotics and navigation system. There are still questions asked about the endoscopic treatment of malignancies which I think would come to a rest on close follow-up of patients and would prove whether endoscopic management of nose paranasal sinus malignancies is effective. A multidisciplinary approach to such patients would also help to achieve a better control of the disease process.

Clinical Rhinology journal is our attempt to bring under one umbrella, some of the most exciting areas of research, collaboration and innovation, give chance to budding otolaryngologists to share their research ideas.

It is our sincere hope that all the otorhinolaryngologists can benefit out of this publication.
